

## QUINAZOLINE DERIVATIVES AS TYROSINE KINASE INHIBITORS

The invention concerns certain novel quinazoline derivatives, or pharmaceutically acceptable salts, or pharmaceutically acceptable esters thereof, which possess anti-tumour activity and are accordingly useful in methods of treatment of the human or animal body. The invention also concerns processes for the manufacture of said quinazoline derivatives, to pharmaceutical compositions containing them and to their use in therapeutic methods, for example in the manufacture of medicaments for use in the prevention or treatment of solid tumour disease in a warm-blooded animal such as man.

Many of the current treatment regimes for diseases resulting from the abnormal regulation of cellular proliferation such as psoriasis and cancer, utilise compounds that inhibit DNA synthesis and cellular proliferation. To date, compounds used in such treatments are generally toxic to cells however their enhanced effects on rapidly dividing cells such as tumour cells can be beneficial. Alternative approaches to these cytotoxic anti-tumour agents are currently being developed, for example selective inhibitors of cell signalling pathways. These types of inhibitors are likely to have the potential to display an enhanced selectivity of action against tumour cells and so are likely to reduce the probability of the therapy possessing unwanted side effects.

Eukaryotic cells are continually responding to many diverse extracellular signals that enable communication between cells within an organism. These signals regulate a wide variety of physical responses in the cell including proliferation, differentiation, apoptosis and motility. The extracellular signals take the form of a diverse variety of soluble factors including growth factors as well as paracrine and endocrine factors. By binding to specific transmembrane receptors, these ligands integrate the extracellular signal to the intracellular signalling pathways, therefore transducing the signal across the plasma membrane and allowing the individual cell to respond to its extracellular signals. Many of these signal transduction processes utilise the reversible process of the phosphorylation of proteins that are involved in the promotion of these diverse cellular responses. The phosphorylation status of target proteins is regulated by specific kinases and phosphatases that are responsible for the regulation of about one third of all proteins encoded by the mammalian genome. As phosphorylation is such an important regulatory mechanism in the signal transduction process, it is therefore not surprising that aberrations in these intracellular pathways result in

abnormal cell growth and differentiation and so promote cellular transformation (reviewed in Cohen *et al*, Curr Opin Chem Biol, 1999, 3, 459-465).

It has been widely shown that a number of these tyrosine kinases are mutated to constitutively active forms and/or when over-expressed result in the transformation of a  
5 variety of human cells. These mutated and over-expressed forms of the kinase are present in a large proportion of human tumours (reviewed in Kolibaba *et al*, Biochimica et Biophysica Acta, 1997, 133, F217-F248). As tyrosine kinases play fundamental roles in the proliferation and differentiation of a variety of tissues, much focus has centred on these enzymes in the development of novel anti-cancer therapies. This family of enzymes is divided into two  
10 groups - receptor and non-receptor tyrosine kinases e.g. EGF Receptors and the SRC family respectively. From the results of a large number of studies including the Human Genome Project, about 90 tyrosine kinase have been identified in the human genome, of this 58 are of the receptor type and 32 are of the non-receptor type. These can be compartmentalised in to 20 receptor tyrosine kinase and 10 non-receptor tyrosine kinase sub-families (Robinson *et al*,  
15 Oncogene, 2000, 19, 5548-5557).

The receptor tyrosine kinases are of particular importance in the transmission of mitogenic signals that initiate cellular replication. These large glycoproteins, which span the plasma membrane of the cell possess an extracellular binding domain for their specific ligands (such as Epidermal Growth Factor (EGF) for the EGF Receptor). Binding of ligand results in  
20 the activation of the receptor's kinase enzymatic activity that is encoded by the intracellular portion of the receptor. This activity phosphorylates key tyrosine amino acids in target proteins, resulting in the transduction of proliferative signals across the plasma membrane of the cell.

It is known that the erbB family of receptor tyrosine kinases, which include EGFR,  
25 erbB2, erbB3 and erbB4, are frequently involved in driving the proliferation and survival of tumour cells (reviewed in Olayioye *et al.*, EMBO J., 2000, 19, 3159). One mechanism in which this can be accomplished is by overexpression of the receptor at the protein level, generally as a result of gene amplification. This has been observed in many common human cancers (reviewed in Klapper *et al.*, Adv. Cancer Res., 2000, 77, 25) such as breast cancer  
30 (Sainsbury *et al.*, Brit. J. Cancer, 1988, 58, 458; Guerin *et al.*, Oncogene Res., 1988, 3, 21; Slamon *et al.*, Science, 1989, 244, 707; Klijn *et al.*, Breast Cancer Res. Treat., 1994, 29, 73 and reviewed in Salomon *et al.*, Crit. Rev. Oncol. Hematol., 1995, 19, 183), non-small cell lung cancers (NSCLCs) including adenocarcinomas (Cerny *et al.*, Brit. J. Cancer, 1986, 54,

265; Reubi *et al.*, *Int. J. Cancer*, 1990, 45, 269; Rusch *et al.*, *Cancer Research*, 1993, 53, 2379; Brabender *et al.*, *Clin. Cancer Res.*, 2001, 7, 1850) as well as other cancers of the lung (Hendler *et al.*, *Cancer Cells*, 1989, 7, 347; Ohsaki *et al.*, *Oncol. Rep.*, 2000, 7, 603), bladder cancer (Neal *et al.*, *Lancet*, 1985, 366; Chow *et al.*, *Clin. Cancer Res.*, 2001, 7, 1957, Zhau *et al.*, *Mol. Carcinog.*, 3, 254), oesophageal cancer (Mukaida *et al.*, *Cancer*, 1991, 68, 142), gastrointestinal cancer such as colon, rectal or stomach cancer (Bolen *et al.*, *Oncogene Res.*, 1987, 1, 149; Kapitanovic *et al.*, *Gastroenterology*, 2000, 112, 1103; Ross *et al.*, *Cancer Invest.*, 2001, 19, 554), cancer of the prostate (Visakorpi *et al.*, *Histochem. J.*, 1992, 24, 481; Kumar *et al.*, 2000, 32, 73; Scher *et al.*, *J. Natl. Cancer Inst.*, 2000, 92, 1866), leukaemia  
10 (Konaka *et al.*, *Cell*, 1984, 37, 1035, Martin-Subero *et al.*, *Cancer Genet Cytogenet.*, 2001, 127, 174), ovarian (Hellstrom *et al.*, *Cancer Res.*, 2001, 61, 2420), head and neck (Shiga *et al.*, *Head Neck*, 2000, 22, 599) or pancreatic cancer (Ovotny *et al.*, *Neoplasma*, 2001, 48, 188). As more human tumour tissues are tested for expression of the erbB family of receptor tyrosine kinases it is expected that their widespread prevalence and importance will be further  
15 enhanced in the future.

As a consequence of the mis-regulation of one or more of these receptors, it is widely believed that many tumours become clinically more aggressive and so correlate with a poorer prognosis for the patient (Brabender *et al.*, *Clin. Cancer Res.*, 2001, 7, 1850; Ross *et al.*, *Cancer Investigation*, 2001, 19, 554, Yu *et al.*, *Bioessays*, 2000, 22, 7, 673). In addition to these  
20 clinical findings, a wealth of pre-clinical information suggests that the erbB family of receptor tyrosine kinases are involved in cellular transformation. This includes the observations that many tumour cell lines overexpress one or more of the erbB receptors and that EGFR or erbB2 when transfected into non-tumour cells have the ability to transform these cells. This tumourigenic potential has been further verified as transgenic mice that overexpress erbB2  
25 spontaneously develop tumours in the mammary gland. In addition to this, a number of pre-clinical studies have demonstrated that anti-proliferative effects can be induced by knocking out one or more erbB activities by small molecule inhibitors, dominant negatives or inhibitory antibodies (reviewed in Mendelsohn *et al.*, *Oncogene*, 2000, 19, 6550). Thus it has been recognised that inhibitors of these receptor tyrosine kinases should be of value as a  
30 selective inhibitor of the proliferation of mammalian cancer cells (Yaish *et al.*, *Science*, 1988, 242, 933, Kolibaba *et al.*, *Biochimica et Biophysica Acta*, 1997, 133, F217-F248; Al-Obeidi *et al.*, 2000, *Oncogene*, 19, 5690-5701; Mendelsohn *et al.*, 2000, *Oncogene*, 19, 6550-6565).

Recently the small molecule EGFR tyrosine kinase inhibitor, Iressa (also known as gefitinib, and ZD1834) has been approved for use in the treatment of advanced non-small cell lung cancer. Furthermore, findings using inhibitory antibodies against EGFR and erbB2 (c-225 and trastuzumab respectively) have proven to be beneficial in the clinic for the treatment of selected solid tumours (reviewed in Mendelsohn *et al.*, 2000, Oncogene, 19, 6550-6565).

Amplification and/or activity of members of the erbB receptor tyrosine kinases have been detected and so have been implicated to play a role in a number of non-malignant proliferative disorders such as psoriasis (Ben-Bassat, Curr. Pharm. Des., 2000, 6, 933; Elder *et al.*, Science, 1989, 243, 811), benign prostatic hyperplasia (BPH) (Kumar *et al.*, Int. Urol. Nephrol., 2000, 32, 73), atherosclerosis and restenosis (Bokemeyer *et al.*, Kidney Int., 2000, 58, 549). It is therefore expected that inhibitors of erbB receptor tyrosine kinases will be useful in the treatment of these and other non-malignant disorders of excessive cellular proliferation.

European patent application EP 566 226 discloses certain 4-anilinoquinazolines that are receptor tyrosine kinase inhibitors.

International patent applications WO 96/33977, WO 96/33978, WO 96/33979, WO 96/33980, WO 96/33981, WO 97/30034, WO 97/38994 disclose that certain quinazoline derivatives which bear an anilino substituent at the 4-position and a substituent at the 6- and/or 7- position possess receptor tyrosine kinase inhibitory activity.

European patent application EP 837 063 discloses aryl substituted 4-aminoquinazoline derivatives carrying moiety containing an aryl or heteroaryl group at the 6-or 7- position on the quinazoline ring. The compounds are stated to be useful for treating hyperproliferative disorders.

WO 02/41882 discloses 4-anilinoquinazoline compounds substituted at the 6- and/or  
5 7- position by a substituted pyrrolidinyl-alkoxy or piperidinyl-alkoxy group.

We have now found that surprisingly certain quinazoline derivatives substituted at the 7-position with a substituent containing certain substituted alkanoyl groups possess potent anti-tumour activity. The compounds of the present invention also generally possess high cellular potency, and favourable physical properties, particularly solubility, which may  
10 provide advantages in the formulation and delivery of the compound to patients. Many of the compounds of the invention possess favourable DMPK properties, for example high bioavailability and/or high free-plasma levels and/or advantageous half life and/or advantageous volume of distribution and such properties are expected to provide improved in-vivo efficacy and may reduce inter-patient variability in exposure to the compound compared  
15 to other EGFR tyrosine kinase inhibitors such as gefitinib.

Furthermore, many of the compounds according to the present invention are inactive or only weakly active in a hERG assay.

Without wishing to imply that the compounds disclosed in the present invention possess pharmacological activity only by virtue of an effect on a single biological process, it  
20 is believed that the compounds provide an anti-tumour effect by way of inhibition of one or more of the erbB family of receptor tyrosine kinases that are involved in the signal transduction steps which lead to the proliferation of tumour cells. In particular, it is believed that the compounds of the present invention provide an anti-tumour effect by way of inhibition of EGFR tyrosine kinase.

25 Generally the compounds of the present invention possess potent inhibitory activity against the erbB receptor tyrosine kinase family, for example by inhibition of EGF and/or erbB2 and/or erbB4 receptor tyrosine kinases, whilst possessing less potent inhibitory activity against other kinases, such as VEGF and KDR receptor tyrosine kinases. Furthermore, the compounds of the present invention possess substantially better potency against the EGFR  
30 tyrosine kinase over that of the erbB2 tyrosine kinase. Accordingly, it may be possible to administer a compound according to the present invention at a dose that is sufficient to inhibit EGFR tyrosine kinase whilst having no significant effect upon erbB2 (or other) tyrosine kinases. The selective inhibition provided by the compounds according to the present

invention may provide treatments for conditions mediated by EGFR tyrosine kinase, whilst reducing undesirable side effects that may be associated with the inhibition of other tyrosine kinases.

According to a first aspect of the invention there is provided a quinazoline derivative

(2-6C)alkenyl, (2-6C)alkynyl, (1-6C)alkoxy, (1-6C)alkylthio, (1-6C)alkylsulfinyl, (1-6C)alkylsulfonyl, (1-6C)alkylamino, di-[(1-6C)alkyl]amino, (2-6C)alkanoyl, (2-6C)alkanoyloxy and from a group of the formula:

5 wherein  $X^{10}$  is a direct bond or is selected from O, CO, SO<sub>2</sub> and N(R<sup>19</sup>), wherein R<sup>19</sup> is hydrogen or (1-4C)alkyl, and R<sup>18</sup> is halogeno-(1-4C)alkyl, hydroxy-(1-4C)alkyl, (1-4C)alkoxy-(1-4C)alkyl, cyano-(1-4C)alkyl, amino-(1-4C)alkyl, N-(1-4C)alkylamino-(1-4C)alkyl and N,N-di-[(1-4C)alkyl]amino-(1-4C)alkyl; provided that:

10 when the 4-anilino group in Formula I is 4-bromo-2-fluoroanilino or 4-chloro-2-fluoroanilino and R<sup>1</sup> is hydrogen or (1-3C)alkoxy, then a is 0 and Z is selected from hydroxy, amino, (1-6C)alkylamino, di-[(1-6C)alkyl]amino, (1-6C)alkoxy, (1-6C)alkylsulfonyl, (1-6C)alkanesulfonylamino, N-(1-6C)alkyl-(1-6C)alkanesulfonylamino, and a group of the formula Q<sup>6</sup>-X<sup>9</sup>;

15 or a pharmaceutically acceptable salt, or a pharmaceutically acceptable ester thereof.

In a particular embodiment of the invention there is provided a quinazoline derivative of the Formula I as defined above, or a pharmaceutically acceptable salt thereof.

In this specification the generic term "alkyl" includes both straight-chain and branched-chain alkyl groups such as propyl, isopropyl and tert-butyl, and (3-7C)cycloalkyl groups such as cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl and cycloheptyl. However  
20 references to individual alkyl groups such as "propyl" are specific for the straight-chain version only, references to individual branched-chain alkyl groups such as "isopropyl" are specific for the branched-chain version only and references to individual cycloalkyl groups such as "cyclopentyl" are specific for that 5-membered ring only. An analogous convention  
25 applies to other generic terms, for example (1-6C)alkoxy includes methoxy, ethoxy, cyclopropyloxy and cyclopentyloxy, (1-6C)alkylamino includes methylamino, ethylamino, cyclobutylamino and cyclohexylamino, and di-[(1-6C)alkyl]amino includes dimethylamino, diethylamino, N-cyclobutyl-N-methylamino and N-cyclohexyl-N-ethylamino.

It is to be understood that, insofar as certain of the compounds of Formula I defined  
30 above may exist in optically active or racemic forms by virtue of one or more asymmetric carbon atoms, the invention includes in its definition any such optically active or racemic form which possesses the above-mentioned activity. It is further to be understood that in the names of chiral compounds (*R,S*) denotes any scalemic or racemic mixture while (*R*) and (*S*)

denote the enantiomers. In the absence of (*R,S*), (*R*) or (*S*) in the name it is to be understood that the name refers to any scalemic or racemic mixture, wherein a scalemic mixture contains *R* and *S* enantiomers in any relative proportions and a racemic mixture contains *R* and *S* enantiomers in the ratio 50:50. The synthesis of optically active forms may be carried out by standard techniques of organic chemistry well known in the art, for example by synthesis from optically active starting materials or by resolution of a racemic form. Similarly, the above-mentioned activity may be evaluated using the standard laboratory techniques referred to hereinafter.

Suitable values for the generic radicals referred to above include those set out below.

- 10 A suitable value for any one of the 'Q' groups (for example Q<sup>2</sup>, Q<sup>4</sup> or Q<sup>6</sup>) when it is (3-7C)cycloalkyl or for the (3-7C)cycloalkyl group within a 'Q' or R group is, for example, cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl or bicyclo[2.2.1]heptyl and a suitable value for any one of the 'Q' groups (for example Q<sup>2</sup>, Q<sup>4</sup> or Q<sup>6</sup>) when it is (3-7C)cycloalkenyl or for the (3-7C)cycloalkenyl group within a 'Q' group is, for example, cyclobutenyl, cyclopentenyl, cyclohexenyl or cycloheptenyl. It is to be understood that reference to (3-7C)cycloalkylene used herein for Q<sup>5</sup> refers to a divalent (3-7C)cycloalkane linking group, which group may be linked via different carbon atoms in the (3-7C)cycloalkylene ring, or which may be linked via a single carbon atom in the (3-7C)cycloalkylene ring. Accordingly, reference to, for example, a "cyclopropylene" group includes cycloprop-1,2-ylene and a cyclopropylidene group of the formula:

However references to an individual (3-7C)cycloalkylene group such as cyclopropylidene are specific for that group only. A similar convention is adopted for the (3-7C)cycloalkenylene groups represented by Q<sup>5</sup>.

- 25 A suitable value for the 'Q' groups, other than Q<sup>1</sup> (for example Q<sup>2</sup>, Q<sup>3</sup>, Q<sup>4</sup> or Q<sup>6</sup>) when it is heterocyclyl or for the heterocyclyl group within a 'Q' group is a non-aromatic saturated (i.e. ring systems with the maximum degree of saturation) or partially saturated (i.e. ring systems retaining some, but not the full, degree of unsaturation) 3 to 10 membered monocyclic or bicyclic ring with up to five heteroatoms selected from oxygen, nitrogen and sulfur, which, unless specified otherwise, may be carbon or nitrogen linked, for example oxiranyl, oxetanyl, azetidyl, tetrahydrofuranyl, 1,3-dioxolanyl, tetrahydropyranyl, 1,4-dioxanyl, oxepanyl, pyrrolinyl, pyrrolidinyl, morpholinyl, tetrahydro-1,4-thiazinyl,

1,1-dioxotetrahydro-1,4-thiazinyl, piperidinyl, homopiperidinyl, piperazinyl, homopiperazinyl, dihydropyridinyl, tetrahydropyridinyl, dihydropyrimidinyl, tetrahydropyrimidinyl, tetrahydrothienyl, tetrahydrothiopyranyl, decahydroisoquinoliny or decahydroquinoliny, particularly tetrahydrofuranyl, tetrahydropyranyl, pyrrolidinyl, morpholinyl, 1,4-oxazepanyl, thiamorpholinyl 1,1-dioxotetrahydro-4H-1,4-thiazinyl, piperidinyl or piperazinyl, more particularly tetrahydrofuran-3-yl, tetrahydropyran-4-yl, tetrahydrothien-3-yl, tetrahydrothiopyran-4-yl, pyrrolidin-1-yl, pyrrolidin-2-yl, pyrrolidin-3-yl, morpholino, morpholin-2-yl, piperidino, piperidin-4-yl, piperidin-3-yl, piperidin-2-yl or piperazin-1-yl. A nitrogen or sulfur atom within a heterocyclyl group may be oxidized to give the corresponding N or S oxide, for example 1,1-dioxotetrahydrothienyl, 1-oxotetrahydrothienyl, 1,1-dioxotetrahydrothiopyranyl or 1-oxotetrahydrothiopyranyl. A suitable value for such a group which bears 1 or 2 oxo or thioxo substituents is, for example, 2-oxopyrrolidinyl, 2-thioxopyrrolidinyl, 2-oxoimidazolidinyl, 2-thioxoimidazolidinyl, 2-oxopiperidinyl, 2,5-dioxopyrrolidinyl, 2,5-dioxoimidazolidinyl or 2,6-dioxopiperidinyl.

Q<sup>1</sup> is piperidinyl, which group is linked to the oxygen in Formula I by a ring carbon atom.

A suitable value for a 'Q' group when it is heterocyclyl-(1-6C)alkyl is, for example, heterocyclylmethyl, 2-heterocyclylethyl and 3-heterocyclylpropyl. The invention comprises corresponding suitable values for 'Q' groups when, for example, rather than a heterocyclyl-(1-6C)alkyl group, an (3-7C)cycloalkyl-(1-6C)alkyl or (3-7C)cycloalkenyl-(1-6C)alkyl is present.

Suitable values for any of the 'R' groups (R<sup>1</sup> to R<sup>19</sup>), W, or for various groups within a X<sup>1</sup>, X<sup>2</sup> or Z group include:-

25 When, as defined hereinbefore Z in Formula I is a group of the formula  $Q^6-X^9$ -, and  $X^9$  is  $SO_2N(R^{16})$ , the  $SO_2$  group is attached to  $Q^6$  and the nitrogen atom is attached to  $X^2$  in Formula I. The same convention is applied to other groups defined herein. For example when  $X^2$  is a group of the formula  $Q^5-(CR^{14}R^{15})_p$ , the  $Q^5$  group is attached to the group Z in Formula I and the  $(CR^{14}R^{15})_p$  group is attached to the  $X^1$  group in Formula I.

30 As defined hereinbefore, adjacent carbon atoms in any (2-6C)alkylene chain within, for example, a  $R^1$  substituent may be optionally separated by the insertion into the chain of a group such as O,  $CON(R^3)$ ,  $N(R^3)$  or  $C\equiv C$ . For example, insertion of a  $C\equiv C$  group into the ethylene chain within a 2-morpholinoethoxy group gives rise to a 4-morpholinobut-2-ynyloxy

group and, for example, insertion of a CONH group into the ethylene chain within a 3-methoxypropoxy group gives rise to, for example, a 2-(2-methoxyacetamido)ethoxy group. It is to be understood that the term (2-6C)alkylene chain refers to any CH<sub>2</sub>CH<sub>2</sub> group (for example within R<sup>1</sup>) and includes, for example alkylene chains within a (1-6C)alkyl, (1-6C)alkoxy, (2-8C)alkenyl, (2-8C)alkenyloxy, (2-8C)alkynyl and (2-8C)alkynyloxy group. For example the insertion of a N(CH<sub>3</sub>) group between the third and fourth carbon atoms in a hex-5-enyloxy group in R<sup>1</sup> gives rise to a 3-(N-methyl-N-allylamino)propoxy group.

When, as defined hereinbefore, any CH<sub>2</sub>=CH- or HC≡C- group within a R<sup>1</sup> substituent optionally bears at the terminal CH<sub>2</sub>= or HC≡ position a substituent such as a group of the formula Q<sup>3</sup>-X<sup>4</sup>- wherein X<sup>4</sup> is, for example, NHCO and Q<sup>3</sup> is a heterocyclyl-(1-6C)alkyl group, suitable R<sup>1</sup> substituents so formed include, for example, N-[heterocyclyl-(1-6C)alkyl]carbamoylethynyl groups such as N-(2-pyrrolidin-1-ylethyl)carbamoylethynyl or N-[heterocyclyl-(1-6C)alkyl]carbamoylethynyl groups such as N-(2-pyrrolidin-1-ylethyl)carbamoylethynyl.

When reference is made herein to a CH<sub>2</sub> or CH<sub>3</sub> group optionally bearing on each said CH<sub>2</sub> or CH<sub>3</sub> group one or more halogeno or (1-6C)alkyl substituents, there are suitably 1 or 2 halogeno or (1-6C)alkyl substituents present on each said CH<sub>2</sub> group and there are suitably 1, 2 or 3 such substituents present on each said CH<sub>3</sub> group.

Where reference is made herein to any CH<sub>2</sub> or CH<sub>3</sub> group optionally bearing on each said CH<sub>2</sub> or CH<sub>3</sub> group a substituent as defined herein, suitable substituents so formed include, for example, hydroxy-substituted heterocyclyl-(1-6C)alkoxy groups such as 2-hydroxy-3-piperidinopropoxy and 2-hydroxy-3-morpholinopropoxy, hydroxy-substituted heterocyclyl-(1-6C)alkylamino groups such as 2-hydroxy-3-piperidinopropylamino and 2-hydroxy-3-morpholinopropylamino, and hydroxy-substituted (2-6)alkanoyl groups such as hydroxyacetyl, 2-hydroxypropionyl and 2-hydroxybutyryl.

Where reference is made herein to "any CH<sub>2</sub> or CH<sub>3</sub> group, other than a CH<sub>2</sub> group within a heterocyclyl group, optionally bearing a substituent", it is to be understood that such a statement is present only to distinguish between optional substituents that may be present on, for example, a CH<sub>3</sub> group in an alkyl group from substituents that may be present on carbon atoms of a heterocyclyl group. Accordingly, it is to be understood, that this statement does not exclude other substituents being present on ring carbon atoms in a heterocyclyl group when it is stated herein that said heterocyclyl group may also optionally bear one or

more substituents. For example, if R<sup>1</sup> is 3-(pyrrolidin-1-yl)propoxy and herein it is stated that a CH<sub>2</sub> or CH<sub>3</sub> group within, for example, a R<sup>1</sup> substituent, other than a CH<sub>2</sub> group within a heterocyclyl group, optionally bears a hydroxy substituent, and that any heterocyclyl group within R<sup>1</sup> optionally bears an alkyl substituent, then the optional hydroxy substituent may be present on a CH<sub>2</sub> of the propoxy group to give for example a 2-hydroxy-3-(pyrrolidin-1-yl)propoxy group. Similarly an alkyl group such as methyl may be present on the pyrrolidinyl ring to give, for example, a 3-(3-methylpyrrolidin-1-yl)propoxy group. Equally, the propoxy group may be substituted by a hydroxy group and the pyrrolidinyl ring may be substituted by a methyl group to give, for example, a 2-hydroxy-3-(3-methylpyrrolidin-1-yl)propoxy group.

For the avoidance of doubt, when W is oxo, a CH<sub>2</sub> in Q<sup>1</sup> is substituted by O to give a C(O) group.

It is to be understood that reference herein to Q<sup>1</sup> being, for example piperidin-4-yl refers to the attachment of the piperidine ring to the oxygen in Formula I. The piperidine ring is further substituted at the 1-position by the group Z-X<sup>2</sup>-X<sup>1</sup>- and optionally bears one or more W substituents on one or more of the available piperidinyl ring carbon atoms.

It is to be understood that certain compounds of the Formula I may exist in solvated as well as unsolvated forms such as, for example, hydrated forms. It is to be understood that the invention encompasses all such solvated forms which exhibit an inhibitory effect on an erbB receptor tyrosine kinase.

It is also to be understood that certain compounds of the Formula I may exhibit polymorphism, and that the invention encompasses all such forms which exhibit an inhibitory effect on an erbB receptor tyrosine kinase.

It is also to be understood that the invention relates to all tautomeric forms of the compounds of the Formula I forms which exhibit an inhibitory effect on an erbB receptor tyrosine kinase.

A suitable pharmaceutically acceptable salt of a compound of the Formula I is, for example, an acid-addition salt of a compound of the Formula I, for example an acid-addition salt with an inorganic or organic acid such as hydrochloric, hydrobromic, sulfuric, trifluoroacetic, citric or maleic acid; or, for example, a salt of a compound of the Formula I which is sufficiently acidic, for example an alkali or alkaline earth metal salt such as a calcium or magnesium salt, or an ammonium salt, or a salt with an organic base such as methylamine, dimethylamine, trimethylamine, piperidine, morpholine or tris-(2-hydroxyethyl)amine.

The term "pharmaceutically acceptable ester" used herein refers to an ester of a quinazoline derivative of the Formula I which hydrolyses in vivo to leave the parent compound or a pharmaceutically acceptable salt thereof. An in-vivo hydrolysable ester of a quinazoline of Formula I may be used to alter or improve the physical and/or pharmacokinetic profile of the parent compound, for example the solubility. Suitable ester groups that may be used in the formation of pharmaceutically acceptable ester prodrugs are well known, for example as discussed in for example:

A particular pharmaceutically acceptable ester of a quinazoline derivative of the Formula I or a pharmaceutically acceptable salt thereof is, an ester formed with a carboxy or, particularly, a hydroxy group (for example when Z is hydroxy) in Formula I, which ester is hydrolysed in the human or animal body to produce the parent quinazoline of Formula I when administered to a warm blooded animal such as a human.

Suitable pharmaceutically acceptable esters for a carboxy group in Formula I include C<sub>1-6</sub>alkoxymethyl esters for example methoxymethyl, C<sub>1-6</sub>alkanoyloxymethyl esters for example pivaloyloxymethyl, phthalidyl esters, C<sub>3-8</sub>cycloalkoxycarbonyloxyC<sub>1-6</sub>alkyl esters for example 1-cyclohexylcarbonyloxyethyl; 1,3-dioxolen-2-onylmethyl esters for example 5-methyl-1,3-dioxolen-2-onylmethyl; and C<sub>1-6</sub>alkoxycarbonyloxyethyl esters for example 1-methoxycarbonyloxyethyl and may be formed at any carboxy group in the compounds of this invention.

Suitable pharmaceutically acceptable esters for a hydroxy group in Formula I or a pharmaceutically acceptable salt thereof include inorganic esters such as phosphate esters,  $\alpha$ -acyloxyalkyl ethers and related compounds, and esters derived from pharmaceutically acceptable aliphatic carboxylic acids, particularly alkanolic, alkenolic, cycloalkanoic and alkanedioic acids, in which each alkyl or alkenyl moiety advantageously has not more than 6 carbon atoms, and may be formed at any hydroxy group in the compounds of this invention, for example when Z is hydroxy or contains a hydroxy group. Following administration, the pharmaceutically acceptable ester undergoes in-vivo hydrolysis breakdown to give the parent carboxy/hydroxy group in the quinazoline derivative of Formula I.

Examples of  $\alpha$ -acyloxyalkyl ethers that may be used to form a pharmaceutically acceptable ester include acetoxymethoxy and 2,2-dimethylpropionyloxymethoxy. A selection of pharmaceutically acceptable ester forming groups for a hydroxy group in Formula I (for example when Z is hydroxy) include (1-6C)alkanoyl, benzoyl, phenylacetyl and substituted benzoyl and phenylacetyl, (1-6C)alkoxycarbonyl (to give alkyl carbonate esters), di-(1-4C)alkylcarbamoyl and N-(di-(1-4C)alkylaminoethyl)-N-(1-4C)alkylcarbamoyl (to give carbamates), di-(1-4C)alkylaminoacetyl and carboxyacetyl. Examples of substituents on benzoyl include chloromethyl or aminomethyl, (1-4C)alkylaminomethyl and di-((1-4C)alkyl)aminomethyl, and morpholino or piperazino linked from a ring nitrogen atom via a methylene linking group to the 3- or 4-position of the benzoyl ring.

Particular pharmaceutically acceptable esters are phosphate esters formed with a hydroxy group in the quinazoline derivative for the Formula I (for example when Z is hydroxy or contains a hydroxy group), or a pharmaceutically acceptable salt thereof. More particularly, pharmaceutically acceptable esters include quinazoline derivatives of the Formula I in which a hydroxy group in Formula I forms a phosphoryl (npd is 1) or phosphiryl (npd is 0) ester of the formula (PD1), or a pharmaceutically acceptable salt thereof:

Another particular pharmaceutically acceptable ester is a quinazoline derivative of the Formula I in which a hydroxy in Formula I (for example when Z is hydroxy) forms a phosphoryl to give a group of the formula (PD1) wherein npd is 1.

Useful intermediates for the preparation of such esters include compounds containing a group of formula (PD1) in which either or both of the -OH groups in (PD1) is independently protected by (1-4C)alkyl (such compounds also being interesting compounds in their own right), phenyl or phenyl-(1-4C)alkyl (such phenyl groups being optionally substituted by 1 or 2 groups independently selected from (1-4C)alkyl, nitro, halo and (1-4C)alkoxy).

Pharmaceutically acceptable esters of a quinazoline derivative of Formula I containing a group such as (PD1), may be prepared by reaction of a quinazoline derivative Formula I with a suitably protected phosphorylating agent (for example, containing a chloro or dialkylamino leaving group), followed by oxidation (if necessary) and deprotection. Suitable phosphorylating agents are well known and include, for example protected phosphoramidite compounds such as a N,N-di-[(1-6C)alkyl]- phosphoramidite, for example di-tert-butyl N,N-diethylphosphoramidite.

It is to be understood that an ester group in the quinazoline derivative of the Formula I may form a pharmaceutically acceptable salt of the ester group and that such salts form part of the present invention. Where pharmaceutically acceptable salts of a pharmaceutically acceptable ester is required this is achieved by conventional techniques well known to those of ordinary skill in the art. Thus, for example, compounds containing a group of formula (PD1), may ionise (partially or fully) to form salts with an appropriate number of counter-ions. By way of example, if a pharmaceutically acceptable ester pro-drug of a quinazoline derivative Formula I contains a (PD1) group, there are two HO-P- functionalities present, each of which may form an appropriate salt with a suitable counter-ion. Suitable salts of a group of the formula (PD1) are base salts such as an alkali metal salt for example sodium, an alkaline earth metal salt for example calcium or magnesium or an organic amine salt for example triethylamine, or tris-(2-hydroxyethyl)amine. Thus for example the group (PD1) may form, a mono- or di-sodium salt).

Particular novel compounds of the invention include, for example, quinazoline derivatives of the Formula I, or pharmaceutically acceptable salts, or pharmaceutically acceptable esters thereof, wherein, unless otherwise stated, each of R<sup>1</sup>, R<sup>2</sup>, W, Q<sup>1</sup>, X<sup>1</sup>, X<sup>2</sup>, a, b and Z has any of the meanings defined hereinbefore or in paragraphs (a) to (nnnn) hereinafter:-

Specific conditions for the above reactions are as follows:

Conditions for Process (a)

- 15 The coupling reaction is conveniently carried out in the presence of a suitable coupling agent, such as a carbodiimide, or a suitable peptide coupling agent, such as a uronium coupling agent, for example O-(7-azabenzotriazol-1-yl)-N,N,N',N'-tetramethyluronium hexafluoro-phosphate (HATU) or O-(1H-Benzotriazol-1-yl)-N,N,N',N'-tetramethyl uronium tetrafluoroborate (TBTU); or a carbodiimide such as dicyclohexylcarbodiimide, optionally in
- 20 the presence of a catalyst such as dimethylaminopyridine or 4-pyrrolidinopyridine.

The coupling reaction is conveniently carried out in the presence of a suitable base. A suitable base is, for example, an organic amine base such as, for example, pyridine, 2,6-lutidine, collidine, 4-dimethylaminopyridine, triethylamine, di-isopropylethylamine, N-methylmorpholine or diazabicyclo[5.4.0]undec-7-ene, or, for example, an alkali or alkaline

25 earth metal carbonate, for example sodium carbonate, potassium carbonate, cesium carbonate or calcium carbonate.

The reaction is conveniently carried out in the presence of a suitable inert solvent or diluent, for example an ester such as or ethyl acetate, a halogenated solvent such as methylene chloride, chloroform or carbon tetrachloride, an ether such as tetrahydrofuran or 1,4-dioxan, an aromatic solvent such as toluene, or a dipolar aprotic solvent such as

- 5 N,N-dimethylformamide, N,N-dimethylacetamide, N-methylpyrrolidin-2-one or dimethylsulfoxide. The reaction is conveniently carried out at a temperature in the range, for example, from 0 to 120°C, conveniently at or near ambient temperature.

- By the term "reactive derivative" of the acid of the formula **III** is meant a carboxylic acid derivative that will react with the quinazoline of formula **II** to give the corresponding
- 10 amide. A suitable reactive derivative of a carboxylic acid of the formula **III** is, for example, an acyl halide, for example an acyl chloride formed by the reaction of the acid and an inorganic acid chloride, for example thionyl chloride; a mixed anhydride, for example an anhydride formed by the reaction of the acid and a chloroformate such as isobutyl chloroformate; an active ester, for example an ester formed by the reaction of the acid and a
- 15 phenol such as pentafluorophenol, or N-hydroxybenzotriazole; or an acyl azide, for example an azide formed by the reaction of the acid and azide such as diphenylphosphoryl azide; an acyl cyanide, for example a cyanide formed by the reaction of an acid and a cyanide such as diethylphosphoryl cyanide. The reaction of such reactive derivatives of carboxylic acid with amines (such as a compound of the formula **II**) is well known in the art, for Example they
- 20 may be reacted in the presence of a base, such as those described above, and in a suitable solvent, such as those described above. The reaction may conveniently be performed at a temperature as described above.

#### Preparation of Starting Materials for Process (a)

- The quinazoline of the formula **II** may be obtained by conventional procedures, for
- 25 example as illustrated in *Reaction Scheme 1*:

### Reaction Scheme 1

wherein  $\text{R}^1$ ,  $\text{R}^2$ ,  $\text{Q}^1$ ,  $\text{W}$ ,  $a$  and  $b$  are as hereinbefore defined, except any functional group is protected if necessary, and whereafter any protecting group that is present is removed by conventional means,  $\text{Pg}$  is a suitable hydroxy protecting group,  $\text{Pg}^1$  is a suitable amino protecting group and  $\text{L}^3$  is a displaceable group.

### Conditions in Reaction Scheme 1

Step(i): Suitable hydroxy protecting groups represented by  $\text{Pg}$  are well known in the art and include those mentioned herein, for example a lower alkanoyl group such as acetyl, or a benzyl group.

A suitable displaceable group  $\text{L}^3$  is, for example, a halogeno (particularly chloro), alkoxy, aryloxy, mercapto, alkylthio, arylthio, alkylsulfinyl, arylsulfinyl, alkylsulfonyl, arylsulfonyl, alkylsulfonyloxy or arylsulfonyloxy group, for example a chloro, bromo, methoxy, phenoxy, pentafluorophenoxy, methylthio, methanesulfonyl, methanesulfonyloxy or toluene-4-sulfonyloxy group. A particular displaceable group  $\text{L}^3$  is chloro.

The reaction is conveniently carried out in the presence of an acid. Suitable acids include, for example hydrogen chloride gas (conveniently dissolved in a suitable solvent such as diethyl ether or dioxane) or hydrochloric acid.

Alternatively the quinazoline derivative of the formula **IIa**, wherein  $L^3$  is halogeno (for example chloro), may be reacted with the aniline in the absence of an acid or a base. In this reaction displacement of the halogeno leaving group  $L^3$  results in the formation of the acid  $HL^3$  in-situ and the autocatalysis of the reaction.

Alternatively, the reaction of the quinazoline of formula **IIa** with the aniline may be carried out in the presence of a suitable base. A suitable base is, for example, an organic amine base such as, for example, pyridine, 2,6-lutidine, collidine, 4-dimethylaminopyridine, triethylamine, di-isopropylethylamine, *N*-methylmorpholine or diazabicyclo[5.4.0]undec-7-ene, or, an alkali or alkaline earth metal carbonate, for example sodium carbonate, potassium carbonate, cesium carbonate or calcium carbonate, or an alkali metal hydride, for example sodium hydride, an alkali metal fluoride such as cesium fluoride, or an alkali metal disilazide such as sodium hexamethyldisilazide.

The above reactions are conveniently carried out in the presence of a suitable inert solvent or diluent, for example an alcohol or ester such as methanol, ethanol, isopropanol or ethyl acetate, a halogenated solvent such as methylene chloride, chloroform or carbon tetrachloride, an ether such as tetrahydrofuran or 1,4-dioxan, an aromatic solvent such as toluene, or a dipolar aprotic solvent such as *N,N*-dimethylformamide, *N,N*-dimethylacetamide, *N*-methylpyrrolidin-2-one, dimethylsulfoxide or acetonitrile. The above reactions are conveniently carried out at a temperature in the range, for example, 0 to 250°C, conveniently in the range 40 to 80°C or, preferably, at or near the reflux temperature of the solvent when used.

The aniline and the compound of the formula **IIa** are commercially available or can be prepared using conventional methods.

Step (ii):

Deprotection using well-known methods. For example when Pg is a benzyl group it may be removed by treating the compound of formula **IIb** with a suitable acid such as trifluoroacetic acid. Alternatively a benzyl protecting group may be removed by metal-catalysed hydrogenation, for example by hydrogenation in the presence of a palladium on carbon catalyst. Similarly, when Pg is a lower alkanoyl group such as acetyl it may be

removed by hydrolysis under basic conditions, for example using ammonia, conveniently as a methanolic ammonia solution.

Step (iiia):

Suitable amino protecting groups Pg<sub>2</sub> are well known, for example tert-

5   butoxycarbonyl (BOC) groups.

L<sup>4</sup> is a suitable displaceable group, for example as described above in relation to L<sup>2</sup>, such as halogeno (particularly chloro or bromo), or an alkylsulfonyloxy (particularly methanesulfonyloxy) or arylsulfonyloxy (particularly toluene-4-sulfonyloxy or 4-nitrophenylsulfonyloxy) group.

10       The reaction of the compound of formula **IIc** with the compound of formula **IId** is conveniently carried out in the presence of a suitable base. Suitable bases include those described above in relation to step (i), such as cesium fluoride or potassium carbonate. The reaction is conveniently carried out in the presence of a suitable inert solvent, for example, a dipolar aprotic solvent such as N,N-dimethylformamide, N,N-dimethylacetamide,  
15   N-methylpyrrolidin-2-one, dimethylsulfoxide or acetonitrile. The above reaction is conveniently carried out at a temperature in the range, for example, 0 to 250°C, conveniently in the range 40 to 80°C or, preferably, at or near the reflux temperature of the solvent when used.

Step (iiib):

20       An alternative to step (iiia) is the coupling of the compound of formula **IIc** with the alcohol of the formula **IIe** using the Mitsunobu coupling reaction. Suitable Mitsunobu conditions are well known and include, for example, reaction in the presence of a suitable tertiary phosphine and a di-alkylazodicarboxylate in an organic solvent such as THF, or suitably dichloromethane and in the temperature range 0°C to 100°C, for example 0°C to  
25   60°C, but suitably at or near ambient temperature. A suitable tertiary phosphine includes for example tri-n-butylphosphine or particularly tri-phenylphosphine. A suitable di-alkylazodicarboxylate includes, for example, diethyl azodicarboxylate (DEAD) or suitably di-tert-butyl azodicarboxylate (DTAD). Details of Mitsunobu reactions are contained in Tet.  
Letts., 31, 699, (1990); The Mitsunobu Reaction, D.L.Hughes, Organic Reactions, 1992,  
30   Vol.42, 335-656 and Progress in the Mitsunobu Reaction, D.L.Hughes, Organic Preparations and Procedures International, 1996, Vol.28, 127-164.

The compounds of the formulae **IId** and **IIe** are commercially available or can be prepared using conventional methods.

**Step (iv):**

Removal of the amino protecting group  $Pg_1$  using well known methods. For example when  $Pg_1$  is a BOC group, by treatment with a suitable acid such as trifluoroacetic acid or hydrochloric acid.

- 5 In an alternative route to that shown in *Reaction Scheme 1*, the aniline in step (i) may be reacted with the unprotected variant of the compound of the formula **IIa** (i.e.  $Pg$  is hydrogen), to give the compound of formula **IIc** directly.

The compound of formula **II** may also be prepared according to *Reaction Scheme 2*:

**10 Reaction Scheme 2**

wherein  $R^1$ ,  $R^2$ ,  $Q^1$ ,  $W$ ,  $a$ ,  $b$ ,  $L^3$  and  $Pg^1$  are as hereinbefore defined, except any functional group is protected if necessary, and whereafter any protecting group that is present is removed by conventional means.

**Conditions in Reaction Scheme 2****15 Step (i):**

Coupling under Mitsunobu conditions as described above in relation to step (iiib) in *Reaction Scheme 1*.

**Step (ii):**

- The reaction is conveniently carried out in the presence of an acid. Suitable acids include, for example hydrogen chloride gas (conveniently dissolved in a suitable solvent such as diethyl ether or dioxane) or hydrochloric acid. The reaction is conveniently carried out in a suitable inert solvent, for example as described in step (i) of *Reaction Scheme 1*. Conveniently, the protecting group  $Pg^1$  is removed in-situ as a result of the acidic conditions during the aniline coupling reaction, for example when  $Pg^1$  is tert-butoxycarbonyl.
- 20

Alternatively, the protecting group may be removed using conventional methods following the reaction.

The quinazoline of the formula **IIg** is commercially available or can be prepared using conventional methods.

- 5      Quinazoline derivatives of the Formula **II** wherein  $R^1$  is heterocyclyl-(2-6C)alkoxy, wherein the heterocyclyl group is nitrogen linked to the (2-6C)alkoxy group may be prepared according to *Reaction Scheme 3*:

### 10      *Reaction Scheme 3*

wherein  $R^1$ ,  $R^2$ ,  $Q^1$ ,  $W$ ,  $X^2$ ,  $L^1$ ,  $L^2$ ,  $a$ ,  $b$  and  $Pg^1$  are as hereinbefore defined, except any functional group is protected if necessary,  $X^{3'}$  is (2-6C)-alkylene and  $Q^2$  is a heterocyclyl group containing an NH ring group, and whereafter any protecting group that is present is removed by conventional means.

- 15      Step (i):  $L^1$  and  $L^2$  are displaceable groups as defined in relation to Process (b), for example halogeno such as chloro. The reaction with the compound of Formula **IIj** may be carried out under analogous conditions to those used in Process (b) described herein.

The compound of Formula **IIj** may be prepared using standard methods, for example as described in WO03/082831 to give a compound of the Formula **IIj** carrying a 2,3-di-

- 20      haloanilines. Analogous methods may be used to prepare compounds of the Formula **IIj** by coupling 4-chloro-6-hydroxy-7-methoxyquinazoline with the appropriate aniline.

Step (ii): Analogous conditions to Process (b) described herein.

Step (iii): Cleavage of the methoxy group under standard conditions for such reactions, for example by treatment of the compound of Formula **IIm** with pyridinium hydrochloride at

- 25      elevated temperature, for example from 60 to 180°C conveniently about 170°C.

Step(iv): Coupling under Mitsunobu conditions as described above in relation to step (iiib) in *Reaction Scheme 1*.

Step (v): Deprotection to remove the amine protecting group  $Pg^1$ , for example when  $Pg^1$  is tert-butoxycarbonyl, by treating the compound of Formula (IIo) with a suitable acid such as

5 trifluoroacetic acid.

Reaction Conditions for Process (b)

A suitable displaceable group  $L^1$  includes for example halogeno such as chloro.

The reaction is conveniently performed in the presence of a suitable base, for example, conveniently in the presence of a suitable base, for example an organic amine base such as,

10 for example, pyridine, 2,6-lutidine, collidine, 4-dimethylaminopyridine, triethylamine, di-isopropylethylamine, *N*-methylmorpholine or diazabicyclo[5.4.0]undec-7-ene, or, for example, an alkali or alkaline earth metal carbonate, for example sodium carbonate, potassium carbonate, cesium carbonate, calcium carbonate, or an alkali metal hydride, for example sodium hydride, or an alkali metal disilazide such as sodium hexamethyldisilazide.

15 The reaction is conveniently carried out in the presence of a suitable inert solvent or diluent, for example a halogenated solvent such as methylene chloride, chloroform or carbon tetrachloride, an ether such as tetrahydrofuran or 1,4-dioxane, an aromatic solvent such as toluene, or a dipolar aprotic solvent such as *N,N*-dimethylformamide, *N,N*-dimethylacetamide, *N*-methylpyrrolidin-2-one or dimethylsulfoxide.

20 The reaction is suitably carried out at a temperature of from 0°C to 30°C, conveniently at ambient temperature.

When Z is hydroxy, the hydroxy group is conveniently protected during the reaction with the compound of Formula II. Suitable protecting groups are well known, for example an alkanoyl group such as acetyl. The protecting group may be removed following reaction with

25 the compound of Formula II by conventional means, for example alkaline hydrolysis in the presence of a suitable base such as sodium hydroxide.

Compounds of the formula IV are commercially available compounds or they are known in the literature, or they can be prepared by standard processes known in the art.

Reaction Conditions for Process (c):

30 A suitable displaceable group represented by  $L^2$  includes, for example a halogeno or a sulfonyloxy group, for example chloro, bromo, methylsulfonyloxy or toluene-4-sulfonyloxy group. A particular group  $L^2$  is chloro.

The reaction is conveniently performed in the presence of a suitable base, for example one of the bases described in relation to Process (b).

The reaction is conveniently carried out in the presence of a suitable inert solvent or diluent, for example a halogenated solvent such as methylene chloride, chloroform or carbon tetrachloride, an ether such as tetrahydrofuran or 1,4-dioxane, an ester such as ethyl acetate, an aromatic solvent such as toluene, or a dipolar aprotic solvent such as N,N-dimethylformamide, N,N-dimethylacetamide, N-methylpyrrolidin-2-one or dimethylsulfoxide.

The reaction is suitably carried out at a temperature of from 0°C to 80°C, conveniently at ambient temperature.

#### Preparation of Starting Materials for Process (c)

The compound of formula V used as starting material may be prepared by, for example, reacting, conveniently in the presence of a suitable base, a quinazoline of the formula II, or salt thereof, as hereinbefore defined in relation to Process (a), with a compound of the formula Va:

Va

wherein  $X^1$  and  $X^2$  are as hereinbefore defined, and  $L^2$  and  $L^5$  are suitable displaceable groups, provided that  $L^5$  is more labile than  $L^2$ .

Suitable displaceable groups represented by  $L^2$  and  $L^5$  include for example halogeno such as chloro.

The reaction is conveniently carried out in the presence of a suitable base and in a suitable inert solvent or diluent as defined above for the reaction of the quinazoline of formula V with the compound of the formula ZH.

The compounds of the formulae ZH and Va are commercially available compounds or they are known in the literature, or they can be prepared by standard processes known in the art.

Conveniently, in an embodiment of Process (c), a quinazoline of Formula I may be prepared directly from a quinazoline of formula II by reacting the quinazoline of formula II with a compound of formula Va and then reacting the resultant product directly with the compound of the formula ZH without isolating the compound of formula V. This reaction enables the quinazoline of Formula I to be prepared in a single reaction vessel starting with the quinazoline of formula II.

### Reaction Conditions for Process (d)

Process (d) may be used to alkylate an NH group in a quinazoline derivative of Formula I, for example when Z is amino or (1-6C)alkylamino, or when the group Z-X<sup>2</sup> carries an amino or (1-6C)alkylamino substituent. Suitable reductive amination conditions are well known in the art. For example, for the production of those quinazoline derivatives of the Formula I which contain an N-methyl group, the corresponding compound containing a N-H group may be reacted with formaldehyde in the presence of a suitable reducing agent. A suitable reducing agent is, for example, a hydride reducing agent, for example formic acid, an alkali metal aluminium hydride such as lithium aluminium hydride, or, suitably, an alkali metal borohydride such as sodium borohydride, sodium cyanoborohydride, sodium triethylborohydride, sodium trimethoxyborohydride and sodium triacetoxymethylborohydride. The reaction is conveniently performed in a suitable inert solvent or diluent, for example tetrahydrofuran and diethyl ether for the more powerful reducing agents such as lithium aluminium hydride, and, for example, methylene chloride or a protic solvent such as methanol and ethanol for the less powerful reducing agents such as sodium triacetoxymethylborohydride and sodium cyanoborohydride. The reaction is suitably performed under acidic conditions in the presence of a suitable acid such as hydrogen chloride or acetic acid, a buffer may also be used to maintain pH at the desired level during the reaction. When the reducing agent is formic acid the reaction is conveniently carried out using an aqueous solution of the formic acid. The reaction is performed at a temperature in the range, for example, -10 to 100°C, such as 0 to 50°C, conveniently, at or near ambient temperature.

Quinazoline derivatives of the Formula I which contain an NH group (for example when Z is amino or (1-6C)alkylamino) may be prepared using one of the processes described hereinbefore. For example by coupling a compound of the Formula II with a suitable, optionally protected, amino acid using Process (a) followed by removal of any protecting groups.

### Reaction conditions for Process (e)

The cleavage reaction may conveniently be carried out by any of the many procedures known for such a transformation. A particularly suitable cleavage reaction is the treatment of a quinazoline derivative of the Formula I wherein R<sup>1</sup> is a (1-6C)alkoxy group with an alkali metal halide such as lithium iodide in the presence of 2,4,6-collidine (2,4,6-trimethylpyridine). We have found that the use of 2,4,6-collidine provides selective cleavage of the (1-6C)alkoxy group at the C6 position on the quinazoline ring. The reaction may be

carried out in the presence of a suitable inert solvent or diluent as defined hereinbefore. Conveniently however the reaction may be performed using only the 2,4,6-collidine without the need for additional solvents/diluents. The reaction is suitably carried out at a temperature in the range, for example, 10 to 170°C, preferably at elevated temperature for example 120 to 170°C, for example approximately 130°C.

#### Reaction conditions for Process (f)

The coupling reaction is conveniently carried out under Mitsunobu conditions as described above in relation to step (iii) in *Reaction Scheme 1*.

#### Preparation of Starting Materials for Process (f)

- 10 The compound of Formula VI used as starting material may be prepared by, for example, the cleavage of a quinazoline derivative of the Formula I, wherein R<sup>1</sup> is, for example, methoxy using Process (e) described hereinbefore. Alternatively, compound of Formula VI may be prepared using conventional procedures. For example, when X<sup>1</sup> is CO, a compound of the Formula VI may be prepared using the method illustrated in *Reaction Scheme 4*:

#### *Reaction Scheme 4*

- wherein R<sup>1</sup>, R<sup>2</sup>, Q<sup>1</sup>, W, X<sup>2</sup>, a, b, Pg and Pg<sup>1</sup> are as hereinbefore defined, except any functional group is protected if necessary, and whereafter any protecting group that is present is removed by conventional means.

#### Conditions in Reaction Scheme 4

**Step (i):** Cleavage of methoxy group under analogous conditions to those described in step (iii) in *Reaction Scheme 3*.

Step (ii) Pg is a suitable hydroxy protecting group as hereinbefore defined, for example an alkanoyl such as acetyl. The group Pg may be introduced under standard conditions for example by reacting the compound of Formula VIb with acetic anhydride.

Step (iii) Coupling under Mitsunobu conditions as described above in relation to step (iiib) in

5 *Reaction Scheme 1.*

Step (iv): Deprotection to remove the protecting group Pg. For example when Pg is acetyl by alkaline hydrolysis in an alcohol, for example using a methanolic ammonia solution.

Step (v): Deprotection to remove the amine protecting group Pg<sup>1</sup>, for example when Pg<sup>1</sup> is tert-butoxycarbonyl, by treating the compound of Formula (VIId) with a suitable acid such a  
10 trifluoroacetic acid.

Step (vi): Coupling with acid Z-X<sup>2</sup>-COOH using the method described above for Process (a).

The quinazoline derivative of the Formula I may be obtained from the above processes in the form of the free base or alternatively it may be obtained in the form of a salt, an acid addition salt. When it is desired to obtain the free base from a salt of the compound of  
15 Formula I, the salt may be treated with a suitable base, for example, an alkali or alkaline earth metal carbonate or hydroxide, for example sodium carbonate, potassium carbonate, calcium carbonate, sodium hydroxide or potassium hydroxide, or by treatment with ammonia for example using a methanolic ammonia solution such as 7N ammonia in methanol.

The protecting groups used in the processes above may in general be chosen from any  
20 of the groups described in the literature or known to the skilled chemist as appropriate for the protection of the group in question and may be introduced by conventional methods.

Protecting groups may be removed by any convenient method as described in the literature or known to the skilled chemist as appropriate for the removal of the protecting group in question, such methods being chosen so as to effect removal of the protecting group with  
25 minimum disturbance of groups elsewhere in the molecule.

Specific examples of protecting groups are given below for the sake of convenience, in which "lower", as in, for example, lower alkyl, signifies that the group to which it is applied preferably has 1-4 carbon atoms. It will be understood that these examples are not exhaustive. Where specific examples of methods for the removal of protecting groups are  
30 given below these are similarly not exhaustive. The use of protecting groups and methods of deprotection not specifically mentioned are, of course, within the scope of the invention.

A carboxy protecting group may be the residue of an ester-forming aliphatic or arylaliphatic alcohol or of an ester-forming silanol (the said alcohol or silanol preferably

containing 1-20 carbon atoms). Examples of carboxy protecting groups include straight or branched chain (1-12C)alkyl groups (for example isopropyl, and tert-butyl); lower alkoxy-lower alkyl groups (for example methoxymethyl, ethoxymethyl and isobutoxymethyl); lower acyloxy-lower alkyl groups, (for example acetoxymethyl, propionyloxymethyl, butyryloxymethyl and pivaloyloxymethyl); lower alkoxycarbonyloxy-lower alkyl groups (for example 1-methoxycarbonyloxyethyl and 1-ethoxycarbonyloxyethyl); aryl-lower alkyl groups (for example benzyl, 4-methoxybenzyl, 2-nitrobenzyl, 4-nitrobenzyl, benzhydryl and phthalidyl); tri(lower alkyl)silyl groups (for example trimethylsilyl and tert-butyldimethylsilyl); tri(lower alkyl)silyl-lower alkyl groups (for example trimethylsilylethyl); and (2-6C)alkenyl groups (for example allyl). Methods particularly appropriate for the removal of carboxyl protecting groups include for example acid-, base-, metal- or enzymically-catalysed cleavage.

Examples of hydroxy protecting groups include lower alkyl groups (for example tert-butyl), lower alkenyl groups (for example allyl); lower alkanoyl groups (for example acetyl); lower alkoxycarbonyl groups (for example tert-butoxycarbonyl); lower alkenyloxycarbonyl groups (for example allyloxycarbonyl); aryl-lower alkoxycarbonyl groups (for example benzyloxycarbonyl, 4-methoxybenzyloxycarbonyl, 2-nitrobenzyloxycarbonyl and 4-nitrobenzyloxycarbonyl); tri(lower alkyl)silyl (for example trimethylsilyl and tert-butyldimethylsilyl) and aryl-lower alkyl (for example benzyl) groups.

Examples of amino protecting groups include formyl, aryl-lower alkyl groups (for example benzyl and substituted benzyl, 4-methoxybenzyl, 2-nitrobenzyl and 2,4-dimethoxybenzyl, and triphenylmethyl); di-4-anisylmethyl and furylmethyl groups; lower alkoxycarbonyl (for example tert-butoxycarbonyl); lower alkenyloxycarbonyl (for example allyloxycarbonyl); aryl-lower alkoxycarbonyl groups (for example benzyloxycarbonyl, 4-methoxybenzyloxycarbonyl, 2-nitrobenzyloxycarbonyl and 4-nitrobenzyloxycarbonyl); lower alkanoyloxyalkyl groups (for example pivaloyloxymethyl); trialkylsilyl (for example trimethylsilyl and tert-butyldimethylsilyl); alkylidene (for example methylidene) and benzyldiene and substituted benzyldiene groups.

Methods appropriate for removal of hydroxy and amino protecting groups include, for example, acid-, base-, metal- or enzymically-catalysed hydrolysis for groups such as 2-nitrobenzyloxycarbonyl, hydrogenation for groups such as benzyl and photolytically for groups such as 2-nitrobenzyloxycarbonyl. For example a tert butoxycarbonyl protecting

group may be removed from an amino group by an acid catalysed hydrolysis using trifluoroacetic acid.

It will be appreciated that certain of the various ring substituents in the compounds of the present invention may be introduced by standard aromatic substitution reactions or generated by conventional functional group modifications either prior to or immediately following the processes mentioned above, and as such are included in the process aspect of the invention. Such reactions and modifications include, for example, introduction of a substituent by means of an aromatic substitution reaction, reduction of substituents, alkylation of substituents and oxidation of substituents. The reagents and reaction conditions for such procedures are well known in the chemical art. Particular examples of aromatic substitution reactions include the introduction of a nitro group using concentrated nitric acid, the introduction of an acyl group using, for example, an acyl halide and Lewis acid (such as aluminium trichloride) under Friedel Crafts conditions; the introduction of an alkyl group using an alkyl halide and Lewis acid (such as aluminium trichloride) under Friedel Crafts conditions; and the introduction of a halogeno group.

When a pharmaceutically acceptable salt of a quinazoline derivative of the Formula I is required, for example an acid-addition salt, it may be obtained by, for example, reaction of said quinazoline derivative with a suitable acid using a conventional procedure.

When a pharmaceutically acceptable ester of a quinazoline derivative of the Formula I is required, it may be obtained by, for example, reaction of said quinazoline derivative with a suitable acid or alcohol using a conventional procedure as herein described in relation to definition of pharmaceutically acceptable esters.

As mentioned hereinbefore some of the compounds according to the present invention may contain one or more chiral centers and may therefore exist as stereoisomers (for example when Q<sup>1</sup> is piperidin-3-yl). Stereoisomers may be separated using conventional techniques, e.g. chromatography or fractional crystallisation. The enantiomers may be isolated by separation of a racemate for example by fractional crystallisation, resolution or HPLC. The diastereoisomers may be isolated by separation by virtue of the different physical properties of the diastereoisomers, for example, by fractional crystallisation, HPLC or flash

chromatography. Alternatively particular stereoisomers may be made by chiral synthesis from chiral starting materials under conditions which will not cause racemisation or epimerisation, or by derivatisation, with a chiral reagent. When a specific stereoisomer is isolated it is suitably isolated substantially free for other stereoisomers, for example containing less than 5 20%, particularly less than 10% and more particularly less than 5% by weight of other stereoisomers.

In the section above relating to the preparation of the quinazoline derivative of Formula I, the expression "inert solvent" refers to a solvent which does not react with the starting materials, reagents, intermediates or products in a manner which adversely affects the 10 yield of the desired product.

Persons skilled in the art will appreciate that, in order to obtain compounds of the invention in an alternative and in some occasions, more convenient manner, the individual process steps mentioned hereinbefore may be performed in different order, and/or the individual reactions may be performed at different stage in the overall route (i.e. chemical 15 transformations may be performed upon different intermediates to those associated hereinbefore with a particular reaction).

Certain intermediates used in the processes described above are novel and form a further feature of the present invention. According to a further aspect of the present invention there is provided a quinazoline derivative of the Formula II as hereinbefore defined wherein a 20 is 2 and each  $R^2$ , which may be the same or different, is halogeno (particularly selected from fluoro and chloro) and wherein the  $R^2$  groups are located at the ortho (2-) and meta (3-) positions on the aniline ring; or a salt thereof. A particular compound of the Formula II is a compound of the Formula II wherein the anilino group is 3-chloro-2-fluoroanilino or 3-bromo-2-fluoroanilino, more particularly the anilino group is 3-chloro-2-fluoroanilino. In an 25 embodiment in the compound of Formula II, or a salt thereof,  $R^1$  is (1-4C)alkoxy; a is 0 or 1; W, when present is on a ring carbon atom in  $Q^1$  and is selected from (1-4C)alkyl, hydroxy and (1-4C)alkoxy (preferably W is 0);  $Q^1$  is piperidin-4-yl and the anilino group is 3-chloro-2-fluoroanilino or 3-bromo-2-fluoroanilino, more particularly the anilino group is 3-chloro-2-fluoroanilino. The intermediate of Formula II may be in the form of a salt of the intermediate. 30 Such salts need not be a pharmaceutically acceptable salt. For example it may be useful to form prepare an intermediate in the form of a pharmaceutically non-acceptable salt if, for example, such salts are useful in the manufacture of a compound of Formula I. Preferably,

salts of the compound of Formula II are pharmaceutically acceptable salts as hereinbefore defined in relation to the quinazoline derivative of Formula I.

### Biological Assays

The inhibitory activities of compounds were assessed in non-cell based protein  
5 tyrosine kinase assays as well as in cell based proliferation assays before their *in vivo* activity was assessed in Xenograft studies.

#### **a) Protein Tyrosine Kinase phosphorylation Assays**

This test measures the ability of a test compound to inhibit the phosphorylation of a tyrosine containing polypeptide substrate by EGFR, erbB2 or erbB4 tyrosine kinase enzyme.

10 Recombinant intracellular fragments of EGFR, erbB2 and erbB4 (accession numbers X00588, X03363 and L07868 respectively) were cloned and expressed in the baculovirus/Sf21 system. Lysates were prepared from these cells by treatment with ice-cold lysis buffer (20mM N-2-hydroxyethylpiperizine-N'-2-ethanesulfonic acid (HEPES) pH7.5, 150mM NaCl, 10% glycerol, 1% Triton X-100, 1.5mM MgCl<sub>2</sub>, 1mM ethylene  
15 glycol-bis(β-aminoethyl ether) N',N',N',N'-tetraacetic acid (EGTA), plus protease inhibitors and then cleared by centrifugation.

Constitutive kinase activity of these recombinant proteins was determined by their ability to phosphorylate a synthetic peptide (made up of a random co-polymer of Glutamic Acid, Alanine and Tyrosine in the ratio of 6:3:1). Specifically, Maxisorb™ 96-well  
20 immunoplates were coated with synthetic peptide (0.2μg of peptide in a 200μl phosphate buffered saline (PBS) solution and incubated at 4°C overnight). Plates were washed in 50mM HEPES pH 7.4 at room temperature to remove any excess unbound synthetic peptide. EGFR or erbB2 activities were assessed by incubation in peptide coated plates for 20 minutes at room temperature in 100mM HEPES pH 7.4 at room temperature, adenosine triphosphate  
25 (ATP) at Km concentration for the respective enzyme, 10mM MnCl<sub>2</sub>, 0.1mM Na<sub>3</sub>VO<sub>4</sub>, 0.2mM DL-dithiothreitol (DTT), 0.1% Triton X-100 with test compound in DMSO (final concentration of 2.5%). Reactions were terminated by the removal of the liquid components of the assay followed by washing of the plates with PBS-T (phosphate buffered saline with 0.5% Tween 20).

30 The immobilised phospho-peptide product of the reaction was detected by immunological methods. Firstly, plates were incubated for 90 minutes at room temperature with anti-phosphotyrosine primary antibodies that were raised in the mouse (4G10 from Upstate Biotechnology). Following extensive washing, plates were treated with Horseradish

Peroxidase (HRP) conjugated sheep anti-mouse secondary antibody (NXA931 from Amersham) for 60 minutes at room temperature. After further washing, HRP activity in each well of the plate was measured colorimetrically using 22'-Azino-di-[3-ethylbenzthiazoline sulfonate (6)] diammonium salt crystals (ABTS™ from Roche) as a substrate.

- 5 Quantification of colour development and thus enzyme activity was achieved by the measurement of absorbance at 405nm on a Molecular Devices ThermoMax microplate reader. Kinase inhibition for a given compound was expressed as an IC<sub>50</sub> value. This was determined by calculation of the concentration of compound that was required to give 50% inhibition of phosphorylation in this assay. The range of phosphorylation was calculated from the positive  
10 (vehicle plus ATP) and negative (vehicle minus ATP) control values.

**b) EGFR driven KB cell proliferation assay**

This assay measures the ability of a test compound to inhibit the proliferation of KB cells (human naso-pharyngeal carcinoma obtained from the American Type Culture Collection (ATCC)).

- 15 KB cells were cultured in Dulbecco's modified Eagle's medium (DMEM) containing 10% foetal calf serum, 2 mM glutamine and non-essential amino acids at 37°C in a 7.5% CO<sub>2</sub> air incubator. Cells were harvested from the stock flasks using Trypsin/ethylaminediaminetetraacetic acid (EDTA). Cell density was measured using a haemocytometer and viability was calculated using trypan blue solution before being seeded  
20 at a density of  $1.25 \times 10^3$  cells per well of a 96 well plate in DMEM containing 2.5% charcoal stripped serum, 1mM glutamine and non-essential amino acids at 37°C in 7.5% CO<sub>2</sub> and allowed to settle for 4 hours.

- Following adhesion to the plate, the cells are treated with or without EGF (final concentration of 1ng/ml) and with or without compound at a range of concentrations in  
25 dimethylsulfoxide (DMSO) (0.1% final) before incubation for 4 days. Following the incubation period, cell numbers were determined by addition of 50µl of 3-(4,5-Dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide (MTT) (stock 5mg/ml) for 2 hours. MTT solution was then tipped off, the plate gently tapped dry and the cells dissolved upon the addition of 100µl of DMSO.

- 30 Absorbance of the solubilised cells was read at 540nm using a Molecular Devices ThermoMax microplate reader. Inhibition of proliferation was expressed as an IC<sub>50</sub> value. This was determined by calculation of the concentration of compound that was required to

give 50% inhibition of proliferation. The range of proliferation was calculated from the positive (vehicle plus EGF) and negative (vehicle minus EGF) control values.

**c) Clone 24 phospho-erbB2 cell assay**

This immunofluorescence end point assay measures the ability of a test compound to  
5 inhibit the phosphorylation of erbB2 in a MCF7 (breast carcinoma) derived cell line which was generated by transfecting MCF7 cells with the full length erbB2 gene using standard methods to give a cell line that overexpresses full length wild type erbB2 protein (hereinafter 'Clone 24' cells).

Clone 24 cells were cultured in Growth Medium (phenol red free Dulbecco's  
10 modified Eagle's medium (DMEM) containing 10% foetal bovine serum, 2 mM glutamine and 1.2mg/ml G418) in a 7.5% CO<sub>2</sub> air incubator at 37°C. Cells were harvested from T75 stock flasks by washing once in PBS (phosphate buffered saline, pH7.4, Gibco No. 10010-015) and harvested using 2mls of Trypsin (1.25mg/ml) / ethylenediaminetetraacetic acid (EDTA) (0.8mg/ml) solution. The cells were resuspended in Growth Medium. Cell density  
15 was measured using a haemocytometer and viability was calculated using Trypan Blue solution before being further diluted in Growth Medium and seeded at a density of  $1 \times 10^4$  cells per well (in 100ul) into clear bottomed 96 well plates (Packard, No. 6005182).

3 days later, Growth Medium was removed from the wells and replaced with 100ul Assay Medium (phenol red free DMEM, 2mM glutamine, 1.2mg/ml G418) either with or  
20 without erbB inhibitor compound. Plates were returned to the incubator for 4hrs and then 20ul of 20% formaldehyde solution in PBS was added to each well and the plate was left at room temperature for 30 minutes. This fixative solution was removed with a multichannel pipette, 100ul of PBS was added to each well and then removed with a multichannel pipette and then 50ul PBS was added to each well. Plates were then sealed and stored for up to 2 weeks at 4°C.

25 Immunostaining was performed at room temperature. Wells were washed once with 200ul PBS / Tween 20 (made by adding 1 sachet of PBS / Tween dry powder (Sigma, No. P3563) to 1L of double distilled H<sub>2</sub>O) using a plate washer then 200ul Blocking Solution (5% Marvel dried skimmed milk (Nestle) in PBS / Tween 20) was added and incubated for 10 minutes. Blocking Solution was removed using a plate washer and 200ul of 0.5% Triton X-  
30 100 / PBS was added to permeabilise the cells. After 10 minutes, the plate was washed with 200ul PBS / Tween 20 and then 200ul Blocking Solution was added once again and incubated for 15 minutes. Following removal of the Blocking Solution with a plate washer, 30ul of rabbit polyclonal anti-phospho ErbB2 IgG antibody (epitope phospho-Tyr 1248, SantaCruz,

No. SC-12352-R), diluted 1:250 in Blocking Solution, was added to each well and incubated for 2 hours. Then this primary antibody solution was removed from the wells using a plate washer followed by two 200µl PBS / Tween 20 washes using a plate washer. Then 30µl of Alexa-Fluor 488 goat anti-rabbit IgG secondary antibody (Molecular Probes, No. A-11008),  
5 diluted 1:750 in Blocking Solution, was added to each well. From now onwards, wherever possible, plates were protected from light exposure, at this stage by sealing with black backing tape. The plates were incubated for 45 minutes and then the secondary antibody solution was removed from the wells followed by two 200ul PBS / Tween 20 washes using a plate washer. Then 100µl PBS was added to each plate, incubated for 10 minutes and then  
10 removed using a plate washer. Then a further 100µl PBS was added to each plate and then, without prolonged incubation, removed using a plate washer. Then 50µl of PBS was added to each well and plates were resealed with black backing tape and stored for up to 2 days at 4°C before analysis.

The Fluorescence signal in each well was measured using an Acumen Explorer  
15 Instrument (Acumen Bioscience Ltd.), a plate reader that can be used to rapidly quantitate features of images generated by laser-scanning. The instrument was set to measure the number of fluorescent objects above a pre-set threshold value and this provided a measure of the phosphorylation status of erbB2 protein. Fluorescence dose response data obtained with each compound was exported into a suitable software package (such as Origin) to perform  
20 curve fitting analysis. Inhibition of erbB2 phosphorylation was expressed as an IC<sub>50</sub> value. This was determined by calculation of the concentration of compound that was required to give 50% inhibition of erbB2 phosphorylation signal.

#### **d) *In vivo* Xenograft assay**

This assay measures the ability of a test compound to inhibit the growth of a LoVo  
25 tumour (colorectal adenocarcinoma obtained from the ATCC) in Female Swiss athymic mice (Alderley Park, *nu/nu* genotype).

Female Swiss athymic (*nu/nu* genotype) mice were bred and maintained in Alderley Park in negative pressure Isolators (PFI Systems Ltd.). Mice were housed in a barrier facility with 12hr light/dark cycles and provided with sterilised food and water *ad libitum*. All  
30 procedures were performed on mice of at least 8 weeks of age. LoVo tumour cell (colorectal adenocarcinoma obtained from the ATCC) xenografts were established in the hind flank of donor mice by sub cutaneous injections of  $1 \times 10^7$  freshly cultured cells in 100µl of serum free media per animal. On day 5 post-implant, mice were randomised into groups of 7 prior to the

treatment with compound or vehicle control that was administered once daily at 0.1ml/10g body weight. Tumour volume was assessed twice weekly by bilateral Vernier calliper measurement, using the formula  $(\text{length} \times \text{width}) \times \sqrt{(\text{length} \times \text{width}) \times (\pi/6)}$ , where length was the longest diameter across the tumour, and width was the corresponding perpendicular.

- 5 Growth inhibition from start of study was calculated by comparison of the mean changes in tumour volume for the control and treated groups, and statistical significance between the two groups was evaluated using a Students *t* test.

According to a further aspect of the invention there is provided a pharmaceutical composition which comprises a quinazoline derivative of the Formula I, or a pharmaceutically acceptable salt or a pharmaceutically acceptable ester thereof, as defined hereinbefore in association with a pharmaceutically acceptable diluent or carrier.

5           The compositions of the invention may be in a form suitable for oral use (for example as tablets, lozenges, hard or soft capsules, aqueous or oily suspensions, emulsions, dispersible powders or granules, syrups or elixirs), for topical use (for example as creams, ointments, gels, or aqueous or oily solutions or suspensions), for administration by inhalation (for example as a finely divided powder or a liquid aerosol), for administration by insufflation (for  
10 example as a finely divided powder) or for parenteral administration (for example as a sterile aqueous or oily solution for intravenous, subcutaneous, intramuscular or intramuscular dosing or as a suppository for rectal dosing).

          The compositions of the invention may be obtained by conventional procedures using conventional pharmaceutical excipients, well known in the art. Thus, compositions intended  
15 for oral use may contain, for example, one or more colouring, sweetening, flavouring and/or preservative agents.

          The amount of active ingredient that is combined with one or more excipients to produce a single dosage form will necessarily vary depending upon the host treated and the particular route of administration. For example, a formulation intended for oral  
20 administration to humans will generally contain, for example, from 0.5 mg to 0.5 g of active agent (more suitably from 0.5 to 100 mg, for example from 1 to 30 mg) compounded with an appropriate and convenient amount of excipients which may vary from about 5 to about 98 percent by weight of the total composition.

          The size of the dose for therapeutic or prophylactic purposes of a quinazoline  
25 derivative of the formula I will naturally vary according to the nature and severity of the conditions, the age and sex of the animal or patient and the route of administration, according to well known principles of medicine.

          In using a quinazoline derivative of the formula I for therapeutic or prophylactic purposes it will generally be administered so that a daily dose in the range, for example, 0.1  
30 mg/kg to 75 mg/kg body weight is received, given if required in divided doses. In general lower doses will be administered when a parenteral route is employed. Thus, for example, for intravenous administration, a dose in the range, for example, 0.1 mg/kg to 30 mg/kg body weight will generally be used. Similarly, for administration by inhalation, a dose in the range,

for example, 0.05 mg/kg to 25 mg/kg body weight will be used. Oral administration is however preferred, particularly in tablet form. Typically, unit dosage forms will contain about 0.5 mg to 0.5 g of a compound of this invention.

We have found that the compounds of the present invention possess anti-proliferative properties such as anti-cancer properties that are believed to arise from their erbB family receptor tyrosine kinase inhibitory activity, particularly inhibition of the EGF receptor (erbB1) tyrosine kinase. Furthermore, certain of the compounds according to the present invention possess substantially better potency against the EGF receptor tyrosine kinase, than against other tyrosine kinase enzymes, for example erbB2, VEGF or KDR receptor tyrosine kinases. Such compounds possess sufficient potency against the EGF receptor tyrosine kinase that they may be used in an amount sufficient to inhibit EGF receptor tyrosine kinase whilst demonstrating little, or significantly lower, activity against other tyrosine kinase enzymes such as erbB2. Such compounds are likely to be useful for the selective inhibition of EGF receptor tyrosine kinase and are likely to be useful for the effective treatment of, for example EGF driven tumours.

Accordingly, the compounds of the present invention are expected to be useful in the treatment of diseases or medical conditions mediated alone or in part by erbB receptor tyrosine kinases (especially EGF receptor tyrosine kinase), i.e. the compounds may be used to produce an erbB receptor tyrosine kinase inhibitory effect in a warm-blooded animal in need of such treatment. Thus the compounds of the present invention provide a method for the treatment of malignant cells characterised by inhibition of one or more of the erbB family of receptor tyrosine kinases. Particularly the compounds of the invention may be used to produce an anti-proliferative and/or pro-apoptotic and/or anti-invasive effect mediated alone or in part by the inhibition of erbB receptor tyrosine kinases. Particularly, the compounds of the present invention are expected to be useful in the prevention or treatment of those tumours that are sensitive to inhibition of one or more of the erbB receptor tyrosine kinases, such as EGF and/or erbB2 and/or erbB4 receptor tyrosine kinases (especially EGF receptor tyrosine kinase) that are involved in the signal transduction steps which drive proliferation and survival of these tumour cells. Accordingly the compounds of the present invention are expected to be useful in the treatment of psoriasis, benign prostatic hyperplasia (BPH), atherosclerosis and restenosis and/or cancer by providing an anti-proliferative effect, particularly in the treatment of erbB receptor tyrosine kinase sensitive cancers. Such benign or malignant tumours may affect any tissue and include non-solid tumours such as leukaemia,

multiple myeloma or lymphoma, and also solid tumours, for example bile duct, bone, bladder, brain/CNS, breast, colorectal, endometrial, gastric, head and neck, hepatic, lung (particularly non-small-cell lung), neuronal, oesophageal, ovarian, pancreatic, prostate, renal, skin, testicular, thyroid, uterine and vulval cancers.

tumour cells which comprises administering to said animal an effective amount of a quinazoline derivative of the Formula I, or a pharmaceutically acceptable salt, or a pharmaceutically acceptable ester thereof, as defined hereinbefore.

According to a further feature of this aspect of the invention there is provided a  
5 compound of the Formula I, or a pharmaceutically acceptable salt, or a pharmaceutically acceptable ester thereof, for use in the prevention or treatment of those tumours in a warm-blooded animal such as a human which are sensitive to inhibition of erbB receptor tyrosine kinases, such as EGFR and/or erbB2 and/or erbB4 (especially EGFR) tyrosine kinases, that are involved in the signal transduction steps which lead to the proliferation of tumour cells.

20 defined hereinbefore.

According to a further feature of this aspect of the invention there is provided a compound of the Formula I, or a pharmaceutically acceptable salt, or a pharmaceutically acceptable ester thereof, for use in providing a EGFR and/or erbB2 and/or erbB4 (especially a EGFR) tyrosine kinase inhibitory effect in a warm-blooded animal such as a human.

25 According to a further feature of the present invention there is provided the use of a quinazoline derivative of the Formula I, or a pharmaceutically acceptable salt, or a pharmaceutically acceptable ester thereof, as defined hereinbefore in the manufacture of a medicament for use in providing a selective EGFR tyrosine kinase inhibitory effect in a warm-blooded animal such as a human.

30 According to a further feature of this aspect of the invention there is provided a method for providing a selective EGFR tyrosine kinase inhibitory effect in a warm-blooded animal such as a human which comprises administering to said animal an effective amount of

a quinazoline derivative of the Formula I, or a pharmaceutically acceptable salt, or a pharmaceutically acceptable ester thereof, as defined hereinbefore.

According to a further feature of this aspect of the invention there is provided a compound of the Formula I, or a pharmaceutically acceptable salt, or a pharmaceutically acceptable ester thereof, for use in providing a selective EGFR tyrosine kinase inhibitory effect in a warm-blooded animal such as a human.

By "a selective EGFR kinase inhibitory effect" is meant that the quinazoline derivative of Formula I is more potent against EGF receptor tyrosine kinase than it is against other kinases. In particular some of the compounds according to the invention are more potent against EGF receptor kinase than it is against other tyrosine kinases such as other erbB receptor tyrosine kinases such as erbB2. For example a selective EGFR kinase inhibitor according to the invention is at least 5 times, preferably at least 10 times more potent against EGF receptor tyrosine kinase than it is against erbB2 tyrosine kinase, as determined from the relative  $IC_{50}$  values in suitable assays. For example, by comparing the  $IC_{50}$  value from the KB cell assay (a measure of the EGFR tyrosine kinase inhibitory activity) with the  $IC_{50}$  value from the Clone 24 phospho-erbB2 cell assay (a measure of erb-B2 tyrosine kinase inhibitory activity) for a given test compound as described above.

According to a further aspect of the present invention there is provided the use of a quinazoline derivative of the Formula I, or a pharmaceutically acceptable salt, or a pharmaceutically acceptable ester thereof, as defined hereinbefore in the manufacture of a medicament for use in the treatment of a cancer (for example a cancer selected from leukaemia, multiple myeloma, lymphoma, bile duct, bone, bladder, brain/CNS, breast, colorectal, endometrial, gastric, head and neck, hepatic, lung (particularly non-small-cell lung), neuronal, oesophageal, ovarian, pancreatic, prostate, renal, skin, testicular, thyroid, uterine and vulval cancer) in a warm-blooded animal such as a human..

According to a further feature of this aspect of the invention there is provided a method for treating a cancer (for example a cancer selected from leukaemia, multiple myeloma, lymphoma, bile duct, bone, bladder, brain/CNS, breast, colorectal, endometrial, gastric, head and neck, hepatic, lung (particularly non-small-cell lung), neuronal, oesophageal, ovarian, pancreatic, prostate, renal, skin, testicular, thyroid, uterine and vulval cancer) in a warm-blooded animal, such as a human, in need of such treatment, which comprises administering to said animal an effective amount of a quinazoline derivative of the

Formula I, or a pharmaceutically acceptable salt, or a pharmaceutically acceptable ester thereof, as defined hereinbefore.

According to a further aspect of the invention there is provided a compound of the Formula I, or a pharmaceutically acceptable salt, or a pharmaceutically acceptable ester thereof, for use in the treatment of a cancer (for example selected from leukaemia, multiple myeloma, lymphoma, bile duct, bone, bladder, brain/CNS, breast, colorectal, endometrial, gastric, head and neck, hepatic, lung (particularly non-small-cell lung), neuronal, oesophageal, ovarian, pancreatic, prostate, renal, skin, testicular, thyroid, uterine and vulval cancer) in a warm-blooded animal such as a human.

As mentioned above the size of the dose required for the therapeutic or prophylactic treatment of a particular disease will necessarily be varied depending upon, amongst other things, the host treated, the route of administration and the severity of the illness being treated.

The anti-proliferative treatment/tyrosine kinase inhibitory effect/ anti-cancer treatment defined hereinbefore may be applied as a sole therapy or may involve, in addition to the compound of the invention, conventional surgery or radiotherapy or chemotherapy. Such chemotherapy may include one or more of the following categories of anti-tumour agents :-

#### *N*-(3-Chloro-2-fluorophenyl)-7-((1-[(dimethylamino)acetyl]piperidin-4-yl)oxy)-6-methoxyquinazolin-4-amine

*N,N*-Dimethylaminoacetyl chloride hydrochloride (100mg) was added portionwise to a stirred solution of *N*-(3-chloro-2-fluorophenyl)-6-methoxy-7-(piperidin-4-yloxy)quinazolin-4-amine dihydrochloride (250mg, 0.57mmol) and diisopropylethylamine (300  $\mu$ l) in methylene chloride (25 ml) at 0°C. The reaction mixture was allowed to stir for 2 hours to  
15 room temperature. The reaction mixture was washed with saturated sodium bicarbonate solution (25ml), dried (MgSO<sub>4</sub>), filtered and evaporated. The residues were purified by column chromatography eluting with increasingly polar mixtures of methylene chloride/methanol (100/0 to 90/10), followed by methylene chloride/methanol (saturated with ammonia) (90/10). The fractions containing the desired product were combined and  
20 evaporated under vacuum to give the title product as a white foam (0.125g, 45%); <sup>1</sup>H NMR Spectrum: (DMSO d<sub>6</sub>) 1.50-1.65 (m, 1H); 1.65-1.80 (m, 1H); 1.95-2.15 (m, 2H); 2.25 (s, 6H); 3.10-3.50 (m, 4H); 3.75-4.05 (m, 2H); 3.95 (s, 3H); 4.90 (m, 1H); 7.30 (m, 1H); 7.35 (s, 1H); 7.40-7.60 (m, 2H); 7.85 (s, 1H); 8.40 (s, 1H); 9.65 (s, 1H); Mass Spectrum: (M+H)<sup>+</sup> 488.

The *N*-(3-chloro-2-fluorophenyl)-6-methoxy-7-(piperidin-4-yloxy)quinazolin-4-amine  
25 dihydrochloride used as starting material was prepared as follows:

4.0M HCl in Dioxane (4.0 ml) was added to a stirred suspension of 7-(benzyloxy)-4-chloro-6-methoxyquinazoline (CAS Registry No162364-72-9, prepared as described in WO98/13354, Example 1) (60 g, 0.2 mol) and 3-chloro-2-fluoroaniline (31.96 g, 0.22 mol) in acetonitrile (1200 ml). The reaction mixture was heated at 80°C for 1 hour then left to stand

overnight. Acetonitrile (500 ml) was added and the resulting precipitate filtered, washed with acetonitrile (3 x 500 ml) and dried under vacuum to give 7-(benzyloxy)-*N*-(3-chloro-2-fluorophenyl)-6-methoxyquinazolin-4-amine hydrochloride as a beige solid (85.45 g, 96%);

<sup>1</sup>H NMR Spectrum: (DMSO *d*<sub>6</sub>) 4.02 (s, 3H), 5.35 (s, 2H), 7.30-7.60 (m, 9H), 7.65 (m, 1H), 8.38 (s, 1H), 8.85 (s, 1H), 11.8 (s, 1H); Mass Spectrum: (M+H)<sup>+</sup> 410.

A solution of 7-(benzyloxy)-*N*-(3-chloro-2-fluorophenyl)-6-methoxyquinazolin-4-amine hydrochloride (85.45g, 0.192mol) in trifluoroacetic acid (300 ml) was heated at 80°C for 1 hour. The reaction mixture was evaporated to dryness and the residues re-dissolved in methanol (200ml). This solution was then added dropwise to a stirred aqueous solution of saturated sodium bicarbonate (500ml). The resulting precipitate was collected by filtration, washed with acetonitrile and dried under vacuum. The resulting solids were then purified by hot (100°C) trituration with a mixture of butanone (500 ml) and MeOH (100ml), filtered and dried to 4-[3-chloro-2-fluoroanilino]-6-methoxyquinazolin-7-ol as a cream solid (45 g, 73%); <sup>1</sup>H NMR Spectrum: (DMSO *d*<sub>6</sub>): 3.98 (s, 3H), 7.10 (s, 1H), 7.25-7.30 (m, 1H), 7.40-7.50 (m, 1H), 7.50-7.60 (m, 1H), 7.80 (s, 1H), 8.30 (s, 1H), 9.55 (s, 1H), 10.32 (s, 1H); Mass Spectrum: (M+H)<sup>+</sup> 320.

4-[3-chloro-2-fluoroanilino]-6-methoxyquinazolin-7-ol (500 mg, 1.565 mmol) was dissolved in DMA (20 ml). *tert*-Butyl (4-methanesulfonyloxy)piperidine-1-carboxylate (436.6 mg, 1.565 mmol) and cesium fluoride (236.3 mg, 1.565 mmol) were added, and the mixture was heated to 60°C with stirring. After 18 hours, *tert*-butyl 4-methanesulfonyloxypiperidine-1-carboxylate and cesium fluoride were again added in the same quantities to the reaction mixture and heating was continued at 60°C for a further 18 hours. The solvent was evaporated, and the residue was partitioned between saturated aqueous sodium bicarbonate solution (50ml) and EtOAc (2x50ml). The organics were combined, dried over MgSO<sub>4</sub> and evaporated. The resulting product was then purified by column chromatography eluting with increasingly polar mixtures of methylene chloride/EtOAc (100/0 to 0/100). The fractions containing the desired product were combined and evaporated under vacuum to give *tert*-butyl 4-({4-[3-chloro-2-fluoroanilino]-6-methoxyquinazolin-7-yl}oxy)piperidine-1-carboxylate as a colourless foam (757 mg, 96%); <sup>1</sup>H NMR Spectrum: (DMSO-*d*<sub>6</sub>): 1.52 (s, 9H), 1.60-1.80 (m, 2H), 2.02-2.20 (m, 2H), 3.20-3.45 (m, 2H), 3.75-3.92 (m, 2H), 4.05 (s, 3H), 4.95 (m, 1H), 7.32-7.45 (m, 2H), 7.55-7.70 (m, 2H), 7.92 (s, 1H), 8.50 (s, 1H), 9.73 (s, 1H); Mass Spectrum: (M+H)<sup>+</sup> 503.

Trifluoroacetic acid (50 ml) was added to a solution of *tert*-butyl 4-({4-[3-chloro-2-fluoroanilino]-6-methoxyquinazolin-7-yl}oxy)piperidine-1-carboxylate (750 mg, 1.49 mmol) in methylene chloride (1 ml) and triethylsilane (1 ml) and the solution stirred for 1 hour. The reaction mixture was then evaporated under reduced pressure and the residues re-dissolved in EtOAc (5 ml). This solution was then treated with 1M HCl/diethylether (1 ml) followed by more diethylether (50 ml) to give a white precipitate. The resulting solids were collected following centrifugation and dried under vacuum to give *N*-(3-chloro-2-fluorophenyl)-6-methoxy-7-(piperidin-4-yloxy)quinazolin-4-amine dihydrochloride as a white solid (750 mg); <sup>1</sup>H NMR Spectrum: (DMSO-d<sub>6</sub>): 2.00-2.20 (m, 2H), 2.25-2.45 (m, 2H), 3.15-3.50 (m, 4H), 4.15 (s, 3H), 5.02 (m, 1H), 7.48 (m, 1H), 7.60-7.85 m, 3H), 8.35 (s, 1H), 8.85 (s, 1H), 9.56 (bs, 2H); Mass Spectrum : (M+H)<sup>+</sup> 403.
